Examiner's Reasons for Allowance

The following is an examiner's statement of reasons for allowance:

Referring to claims 1-5 and 8-11, the prior art searched and of record neither anticipates nor suggests in the claimed combinations, a fringe field tailoring pixel being arranged exterior and adjacent to the shape edge.

Referring to claims 12 and 14-15, the prior art searched and of record neither anticipates nor suggests in the claimed combinations, morphologically manipulating the original pixel data to substitute fringe field tailoring pixels for original data pixels.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Matsumoto discloses in the prior art the problem encountered in conventional printers which is addressed by a process referred to as "smoothing" whereby an improved print image comprises an original image including a plurality of original pixels comprising at least one shape (e.g., a font character image), the shape inherently having at least one edge forming an interior and exterior to the shape, and a sub-pixel pattern having both on and off (black and white) sub-pixel values replacing one of the

plurality of original pixels. However, the sub-pixel pattern is formed by sub-dividing pixels forming the character image and therefore inherently involves replacing pixels interior and adjacent to the shape edge rather than exclusively exterior and adjacent to the shape edge for enhancing the printing of the original image (see col. 1, lines 11-26). Similarly, Matsumoto's invention involves repairing broken lines of character images using a pixel replacement technique, which involves replacing pixels interior to the character shape edge and not exclusively exterior shape edge (col. 2, lines 28-34 and col. 9, lines 34-45).

Lund discloses an edge smoothing process involved in the conversion of a lower resolution image to a higher resolution image. Every input pixel is mapped into a corresponding super-pixel (four sub-pixels) for original pixel replacement having desirable smoothing characteristics. The pixel replacement involves replacing pixels interior and exterior to the character shape (col. 2, lines 1-12 and col. 3, lines 22-37 and 55-64).

Regarding Oyen cited in the prior Office Action, the Examiner concurs with Applicant's remarks.
